

Beyond our planet

Our costly space probes earnestly seeks signs of life on other planets, but without success.

Life-forms right here at our own door-step, however, have not always received the same earnest respect. Since the 17th century man's destructiveness has had a large part in more than 200 species of animals becoming extinct.

And down the ages man has also been busy killing off vast numbers of his own species through constant warfare.

Meanwhile the way has always been open for us to satisfy our curiosity about life beyond our planet, and to discover the path to peace right here on planet Earth.

First, in the Bible, God reveals the origins of man and of our animal and plant kingdoms.

Second, there too the existence of angels (good and bad) is revealed, as well as the destiny of human spirits after death.

Third, God also unveils much about himself, He who is the source of all life.

And through Jesus, He offers his peace to warring man. It's all there in the Book.

While finding evidence of living organisms on other planets may capture our imagination, surely it is far more important that we find eternal life (God's free gift to man) right here on our own planet.
